600.0000000 (10)

Try to separate in multiple steps... And explain each step Creates N entries of pairs of values (X,Y) pairs. This is our row ss := seq([1,2], p=1..N)

$$[1, 2], [1, 2], [1, 2], [1, 2], [1, 2], [1, 2], [1, 2]$$
 (11)

Here we create i many rows of ss. So array is like Nxi but eat entry is 1x2 each row is a new position (X,Y) for each of 8 particles. $Array(\lceil seq(\lceil ss \rceil, i=1..Nt) \rceil)$

everyrhing in 1 step as kyrkos did

Maybe make two separate arrays for YY and XX

XX := Array([IR[1], op([seq([seq([rr(), rr()], k=1..N)], i=1..Nt)])]): VV := Array([IV[1], op([seq([seq([1, 2], k=1..N)], i=1..Nt)])]):

maybe different approach for array?

FF := Array([IR[1], seq([[op([1, 2])], [op([1, 2])]], o = 1..2)])

we cannot have particle act on itself becasue it does not, byt we have all the other actions on it, so we have N-1 forces on the particle acting. In the piecewise we have tt is the time (row number) and k is the particle number and i is the particle number. Because we need each i with every k summed up. Idea - do piecevise and sum in the loop with the if condition, it k!=i then sum stuff up

$$VFX := (i, k) \rightarrow piecewise (i \neq k, Gx(XX[t-1, i, 1], XX[t-1, k, 1], XX[t-1, i, 2], XX[t-1, k, 2]),$$

0):

$$VFY := (i, k) \rightarrow piecewise(i \neq k, Gy(XX[t-1, i, 1], XX[t-1, k, 1], XX[t-1, i, 2], XX[t-1, k, 2]), 0)$$
:
